

Biodiversity Statement

Last updated: July 2025

Smiths Group recognises the critical role that biodiversity plays in maintaining a healthy planet. As a global business with more than 15,000 colleagues, we have a role to play in protecting ecosystems for future generations. We are committed to understanding and addressing the biodiversity-related impact of our products, our operations and our supply chains in a proactive manner.

In 2024, all sites under operational control were evaluated for biodiversity-related impacts and proximity to critical or high biodiversity value habitats based on geolocation data, using the WWF Biodiversity Risk Filter Suite Tool and other complimentary tools e.g. SBTN. Smiths also began following guidance from TNFD by adopting the LEAP (Locate, Evaluate, Assess, Prepare) approach.

During 2025, biodiversity considerations have been factored into our broader business activities. For direct operations, additional environmental matters, including biodiversity, were newly added into our due diligence process when selecting new sites. Further details are outlined in our 'Risk Assessment for Sites in Water-Stressed Areas and High Biodiversity Value Habitats', which can be viewed [here](#).

We also added biodiversity criteria into our supplier environmental questionnaires, e.g. whether a company has a biodiversity programme or has identified biodiversity-related impacts, risks and dependencies. Guidance was also issued to our businesses to encourage and support ideation for on-site biodiversity projects.

In 2026, Smiths will continue to refine its approach to product and service eco design and disclose product-related lifecycle analysis (LCA) data where possible.

We will review this Biodiversity Statement annually.
